Raspberry PI te anunta cand primesti e-mail

In cadrul acest tutorial vei realiza o mica aplicatie ce va anunta primirea unui email nou. Vei folosi doua leduri brick de culori diferite, acestea fiind conectate la portul GPIO al placii Raspberry PI si se vor aprinde in mod diferit atunci cand primesti email-uri pe contul tau de Gmail.

Conexiunile led-urilor.

Led Rosu IN	RaspberryPI #18
Led Rosu GND	RaspberryPi GND
Led Galben IN	RaspberryPI #23
Led Galben GND	RaspberryPi GND

Instalarea scriptului.

Inainte de a instala scriptul asigura-te ca Raspberry booteaza Raspbian "wheezy", se afla conectat la reteaua de internet si poate fi accesat printr-o sesiune SSH. Adresa de IP a calculatorului o poti lua fie din tabela routerului, fie daca atasezi un monitor HDMI sau un TV. Adresa IP apare inainte de prompt-ul in care ti se cer datele de conectare(user si parola).

Deschide putty sau clientul de SSH, introdu: username, parola si conecteaza-te la placa Raspberry PI folosind SSH.

```
login as: pi
pi@192.168.2.100's password:
Linux raspberrypi 3.2.27+ #250 PREEMPT Thu Oct 18 19:03:02 BST 2012 armv61

The programs included with the Debian GNU/Linux system are free software; the exact distribution terms for each program are described in the individual files in /usr/share/doc/*/copyright.

pi@raspberrypi:~$
```

Este posibil sa ai deja python instalat si pachetele aferente, dar daca ai inceput de putin timp sa experimentezi cu Raspberry atunci trebuie sa urmezi pasii de instalare.

1. Instaleaza Python:

```
sudo apt-get install python-dev
sudo apt-get install python-pip
```

2. Instaleaza libraria python care gestioneaza parsarea feed-ului de e-mail.

sudo pip install feedparser

```
pi@raspberrypi:~$ sudo pip install feedparser
Downloading/unpacking feedparser
  Downloading feedparser-5.1.2.tar.bz2 (199Kb): 199Kb downloaded
  Running setup.py egg_info for package feedparser

Installing collected packages: feedparser
  Running setup.py install for feedparser

Successfully installed feedparser
Cleaning up...
pi@raspberrypi:~$
```

3. Realizeaza un update al distributiei python prin comanda:

sudo easy install -U distribute

4. Instaleaza libraria GPIO prin comanda:

sudo pip install RPI.GPIO

```
pi@raspberrypi:~$ sudo pip install RPi.GPIO
Requirement already satisfied (use --upgrade to upgrade): RPi.GPIO in /usr/lib/python2.7/dist-packages
Cleaning up...
pi@raspberrypi:~$
```

5. Deschide editorul nano pentru a scrie codul sursa (copy-paste):

```
sudo nano raspi gmail.py
```

6. Copiaza codul de mai jos in editor (copy-paste):

```
cat <<! > raspi gmail.py
#!/usr/bin/env python
import RPi.GPIO as GPIO, feedparser, time
USERNAME = "username" # just the part before the @ sign, add yours
PASSWORD = "password"
NEWMAIL OFFSET = int(feedparser.parse("https://" + USERNAME + ":" +
PASSWORD +"@mail.google.com/gmail/feed/atom")["feed"]["fullcount"])
MAIL CHECK FREQ = 60
                          # check mail every 60 seconds
GPIO.setmode(GPIO.BCM)
YELLOW LED = 18
RED LED = 23
GPIO.setup(YELLOW LED, GPIO.OUT)
GPIO.setup(RED LED, GPIO.OUT)
while True:
    newmails = int(feedparser.parse("https://" + USERNAME + ":" +
PASSWORD +"@mail.google.com/gmail/feed/atom")["feed"]["fullcount"])
        if DEBUG:
             print "You have", newmails, "new emails!"
    if newmails > NEWMAIL OFFSET:
             GPIO.output(YELLOW LED, True)
             GPIO.output(RED LED, False)
    else:
             GPIO.output(YELLOW LED, False)
             GPIO.output(RED LED, True)
    time.sleep (MAIL CHECK FREQ)
```

In loc de username si password vei scrie datele de conectare ale contului tau de gmail. Vei avea ceva similar cu ce este mai jos.

```
GNU nano 2.2.6

File: raspi gmail.py

fi/usr/bin/env python

import RPI.GPIO as GPIO, feedparser, time

DEBUG=1

DEBUG=1

PASSWORD=""""

PASSWORD=""""

NEWMAIL OFFSET=1

MAIL_CHECK_FREQ=60

GPIO.setmode(GPIO.BCM)

YILLOW LEDB 2

RED_LED=18

GPIO.setup(GREEN_LED, GPIO.OUT)

While TRUE:

newmails = int(feedparser.parse("https://"+USERNAME+":"+FASSWORD+"@mail.google.com/gmail/feed/atom")("feed")["fullcount"])

if DEBUG=1

if DEBUG=1

if newmails > NewMail, OFFSET:

GPIO.output(RED_LED, True)

GPIO.output(RED_LED, False)

else:

GPIO.output(RED_LED, False)

GPIO.output(RED_LED, False)

GPIO.output(RED_LED, False)

itme.sleep(MAIL_CHECK_FREQ)

!
```

7. Urmeaza sa ii dai permisiunea de executie:

```
sudo chmod +x raspi gmail.py
```

8. Executa script-ul cu comanda:

```
sudo ./raspi gmail.py
```

Concluzie.

Vei avea doua led-uri care se vor aprinde in functie de numarul de email-uri primite.
